ECOVERTA™ by ADVANCED ECO TECHNOLOGIES SOLUTIONS FOR EARTH'S SAKE

In an average home, approximately 10% or more of the total water usage is wasted whilst waiting for the shower or tap to run hot, but now this water can be saved without additional running costs due to the new range of EcoVerta® products.

The revolutionary design of the new EcoVerta® product range enables these systems to divert water at full mains pressure without requiring external power, which ensures no ongoing costs - a feature that clearly differentiates the EcoVerta® series from other systems available.

The EcoVerta® range of products enable the cold "hot" water, which would normally be wasted down the drain, to be captured and diverted for re-use, into a storage or rainwater tank or for direct distribution throughout the garden.

The EcoVerta® series features three products, which range from the standard EcoVerta® to the more versatile EcoVerta

Mixa® and the top-of-the-range EcoVerta Protecta®, all of which function seamlessly and silently in the background once installed, without the need for maintenance or manual operation.

The basic EcoVerta® is suitable for use where a conventional 3-piece tap set is fitted. The compact design is ideally suited for installation underneath a vanity basin or kitchen sink.

The EcoVerta Mixa® is ideal for single lever mixers and a single unit is capable of servicing a whole bathroom or kitchen if required, including the shower, bath and hand basin, or kitchen sink and dishwasher. Compact in design, this unit can be mounted, for example in the ceiling or under the floor (depending on location of pipes).

The EcoVerta Protecta® has been designed to suit all styles of tapware and includes the added benefits of scald protection and constant temperature control, making it ideal for households

with children, elderly or disabled people. This system is also particularly suited to homes where major pressure fluctuations occur when water is drawn from multiple outlets at once.

The EcoVerta Protecta® safety benefits also make this system perfectly suited for commercial use in nursing homes, hospitals, schools, gymnasiums, swimming centres and public amenity blocks.

All models in the range are compatible with mains pressure water heating systems including solar, heat pump and storage heaters, as well as continuous flow systems. Additionally, the range has been designed to integrate with existing water storage tanks installed at ground level, below ground or raised.

Proudly Australian made, the EcoVerta® product range carries Watermark approval to AS 1357.2, and has also been recognised by Good Environmental Choice Australia Ltd as being an innovative eco-friendly product.

For more information on the EcoVerta® product range contact the Tradelink Environmental Solutions team on 1800-PLUMBING.

The water efficient Espace Wall Faced Suite integrates style, elegance & the unique environmental EVO system®.

Please contact your local Tradelink Showroom for additional information on the EVO System® range.
